sys	$0 \mathrm{m} 0,000 \mathrm{s}$

Time

Type

Table 1: Not prefixed

Table 2: If-prefixed

Without the if check in every iteration the string has to be stored in the buffer. Afterwards when it tries to pass it to out, it wont be printed since the state is set to failbit. With the if check there is no need to store things in the buffer, which makes it much faster. So a general rule should be to perform checks before storing things in a buffer when possible.

../58/main.ih

```
1 #include <iostream>
2
3 using namespace std;
```

../58/main.cc

```
1
   #include "main.ih"
 2
                                                                             FTS
 3
   int main(int argc, char **argv)
 4
     ostream out(cout.rdbuf()); // Initialise ostream out using buffer cout
 6
7
                                      // Set the failbit of out
8
     size_t its = atol(argv[1]); // Convert command line argument to its
9
10
11
     for (size_t index = 0; index != its; ++index) // Loop through its
12
       if (out.good()) // If failbit is not set, comment out for other version
         out << "Nr. of command line arguments " << argc << '\n'; // Output
13
14
  }
```

Not bed at all Essel attempt ?

The code does work as intended for the first operation as the default open mode of ofstream is ios_base::out. This means that it immediately tries to write to the file, and create said file if it is not available. Conversely, fstream is meant for both reading and writing, and thus its default open mode is ios_base::in | ios_base::out: first open the file, then write to it. Since it does not exist, it can't open it, and won't continue.

The code can be fixed in a number of ways. First, the second operation could simply make use of ofstream as well. In this case, this is probably the best solution as the use of ofstream indicates that this concerns a 'write-only' application. Secondly, the default open mode of fstream can be overridden using the following parameter out2{ "./tmp/out2", ios_base::out };. Third, the file could be created first, before running the operation; either manually or by some other means in the code itself.

I The Hal fine on

As before, istr has error state flags. After it has been assigned to something for the first time, istr is now fully read until its end, and its eofbit has been set / toggled accordingly. In order to utilise istr again, its error state flags must be cleared, using std::ios::clear (i.e. istr.clear();).

```
2
  cout << "extracted first number: " << no1 << '\n';</pre>
3
                       // Clear error state flags
4
  istr.clear();
  istr.str(argv[2]); // Sets istr to a copy of argv[2]
  size_t no2 = 0;
  istr >> no2;
                       // Assign contents of istr to no2
  . . .
```

../61/main.cc

```
1 #include <iostream>
2 #include <iomanip>
3 #include <ctime>
4
5 using namespace std;
6
7 ostream &now(std::ostream &stream)
8 {
  9
10
11
12 }
13
14 int main()
15 {
16
  cout << now << '\n';
                                   // Print
17 }
```

```
MAR (not a declaration)
   void fun(...)
1
2
  {
  } // This is a variadic function declaration. It does not 'do' anything, per se,
    // but it does allow the program to compile.
5
6
   int main()
7
8
       fun();
9
       fun("with functions");
10
       fun(1, 2, 3);
11 }
```

../63/main.cc

```
1 #include <iomanip>
2 #include <iostream>
3
4
  using namespace std;
5
6
   int main()
7
8
     double value = 12.04;
9
     cout << setw(15)
                                                            << value << '\n'
10
                                                            << value << '\n'
11
           << setw(15) << left
                                                            << value << '\n'
12
           << setw(15) << right
           << setw(15) << fixed << setprecision(1)
13
                                                            << value << '\n'
                                                            << value << '\n'
           << setw(15) << fixed << setprecision(4)
14
           << setw(15) << resetiosflags(std::cout.flags()) << value << '\n';
15
16 }
```

In general, tailing a file would be easier in C than it would be in C++ as C is a system programming language, and C++ is not, at least not without calling C-functions. This implies that there is usually one or more more level(s) of abstraction between a file and the program in C++. In this case, this abstraction is in the form of a buffer. When buffering, or reading, a file is blocked from being accessed by another program, possibly the one that may be adding the additional information that we are interested in to the file. Hence, more low-level access to a file (through a more low-level language) would definitely better facilitate such functionality.

../65/main.ih

```
1
   #include <iostream>
   #include <asm/types.h>
                                                This looks like C, not C++.
   #include <sys/acct.h>
   #include <fstream>
  #include <csignal>
   #include <iomanip>
                                                with all functions and vo
   #include <cstring>
8
9
                                                classes, and the user being
   using namespace std;
10
11
   struct clOptions
                                                objects returned from functions
12
     char const **filePaths = 0;
13
     bool dispAllVars = 0;
14
15
16
   void printAccts(size_t idx, clOptions runOptions);
17
   void destroy(struct clOptions);
18
   string exitcode (__u32 exitcode);
  struct clOptions processArgv(int argc, char **argv);
   size_t numStructs(const char *filePath);
   void populateAcct(acct_v3 &acct, ifstream &stream);
                                        ../65/main.cc
   #include "main.ih"
3
   int main(int argc, char **argv)
4
     clOptions runOptions = processArgv(argc, argv);
6
7
     for (int) idx = 0; runOptions.filePaths[idx] != 0; ++idx)
8
                                                    For your convenience, take à
       printAccts(idx, runOptions);
9
10
                                                   different approach :
     destroy(runOptions);
11
                                       ../65/destroy.cc - Look for '-a' i- the condline
                                                        sigure. ts. It you find it,
   #include "main.ih"
                                                        susp it with the first tile meme
   void destroy(clOptions toBeDeleted)
3
4
     delete[] toBeDeleted.filePaths; // Release the memory if there are any
                                                      - I tende over the files one at a kind
                                       ../65/exitcode.cc
                                                         That way, you don't need to
  #include "main.ih"
   string exitcode(__u32 exitcode) // Formats the exitcode print/statements
4
                                               Alternatively, just count the filenames and use a local know-dynamic) away of [strings.
     switch (exitcode)
```

```
6
7
        case SIGTERM:
